Assignment 6: GLMs (Linear Regressios, ANOVA, & t-tests)

Aubrey Knier

OVERVIEW

This exercise accompanies the lessons in Environmental Data Analytics on generalized linear models.

Directions

1. Change "Student Name" on line 3 (above) with your name.
2. Work through the steps, **creating code and output** that fulfill each instruction.
3. Be sure to **answer the questions** in this assignment document.
4. When you have completed the assignment, **Knit** the text and code into a single PDF file.
5. After Knitting, submit the completed exercise (PDF file) to the dropbox in Sakai. Add your last name into the file name (e.g., "Fay_A06_GLMs.Rmd") prior to submission.

The completed exercise is due on Monday, February 28 at 7:00 pm.

Set up your session

1. Set up your session. Check your working directory. Load the tidyverse, agricolae and other needed packages. Import the *raw* NTL-LTER raw data file for chemistry/physics (`NTL-LTER_Lake_ChemistryPhysics_Raw.csv`). Set date columns to date objects.

2. Build a ggplot theme and set it as your default theme.

```
#1
setwd("/Users/aubreyknier/Desktop/Spring 2022/ENV872_EDA/Environmental_Data_Analytics_2022")
getwd()
```

```
## [1] "/Users/aubreyknier/Desktop/Spring 2022/ENV872_EDA/Environmental_Data_Analytics_2022"
```

```
library(tidyverse)
```

```

library(lubridate)
```

```
##
## Attaching package: 'lubridate'

## The following objects are masked from 'package:base':
##
##     date, intersect, setdiff, union
```

```r
NTL_LTER_data <- read.csv("./Data/Raw/NTL-LTER_Lake_ChemistryPhysics_Raw.csv", stringsAsFactors = T)

class(NTL_LTER_data$sampledate)
```

```
## [1] "factor"
```

```r
NTL_LTER_data$sampledate <- as.Date(NTL_LTER_data$sampledate, format = "%m/%d/%y")
class(NTL_LTER_data$sampledate)
```

```
## [1] "Date"
```

```r
#2
mytheme <- theme_classic(base_size = 12) +
  theme(axis.text = element_text(color = "purple"),
        legend.position = "right")
theme_set(mytheme)
```

Simple regression

Our first research question is: Does mean lake temperature recorded during July change with depth across all lakes?

3. State the null and alternative hypotheses for this question:

   > Answer: Ho: Mean lake temperature recorded during July does not change with depth across all lakes. (Slope = 0) Ha: Mean lake temperature recorded during July does change with depth across all lakes. (Slope =/= 0)

4. Wrangle your NTL-LTER dataset with a pipe function so that the records meet the following criteria:

- Only dates in July.
- Only the columns: `lakename`, `year4`, `daynum`, `depth`, `temperature_C`
- Only complete cases (i.e., remove NAs)

5. Visualize the relationship among the two continuous variables with a scatter plot of temperature by depth. Add a smoothed line showing the linear model, and limit temperature values from 0 to 35 °C. Make this plot look pretty and easy to read.

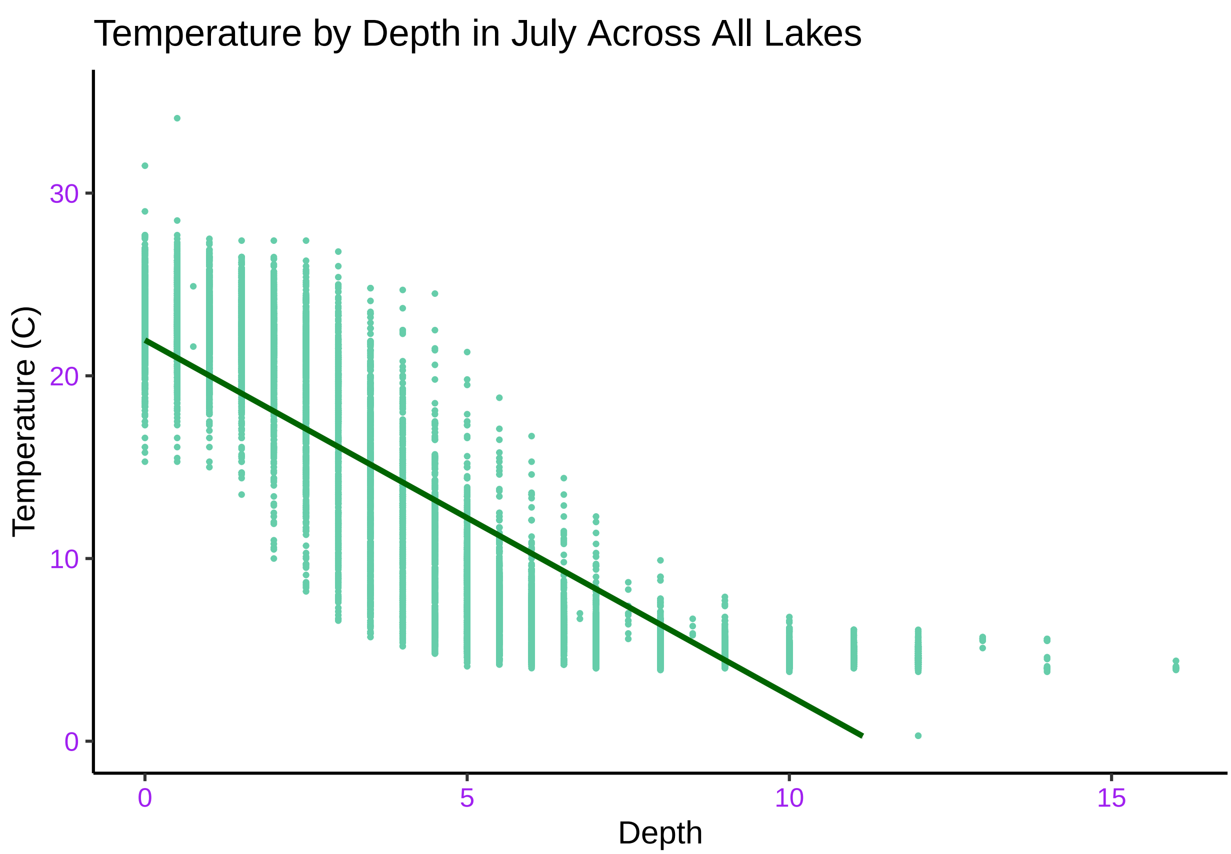
```r
#4
NTL_LTER_data$Month <- month(NTL_LTER_data$sampledate)

NTL_LTER_subset <- NTL_LTER_data %>%
  filter(Month == 7) %>%
    select(`lakename`, `year4`, `daynum`, `depth`, `temperature_C`) %>%
      na.omit()

#5
ggplot(NTL_LTER_subset, aes(x=depth, y=temperature_C)) +
  geom_point(size=.5, col="aquamarine3") +
    geom_smooth(method="lm", col="darkgreen") +
      ylim(0,35) +
        ylab("Temperature (C)") +
          xlab("Depth") +
            ggtitle("Temperature by Depth in July Across All Lakes")
```

```
## `geom_smooth()` using formula 'y ~ x'
```

```
## Warning: Removed 24 rows containing missing values (geom_smooth).
```



6. Interpret the figure. What does it suggest with regards to the response of temperature to depth? Do the distribution of points suggest about anything about the linearity of this trend?

Answer: The figure above suggests that temperature and depth have a negative relationship; as depth increases, temperature decreases; as temperature increases, depth decreases. The distribution of points have a curved shape and therefore suggests that the relationship may be non-linear.

7. Perform a linear regression to test the relationship and display the results

```
#7
NTL_LTER_lm <- lm(temperature_C~depth, data=NTL_LTER_subset)
summary(NTL_LTER_lm)
```

```
##
## Call:
## lm(formula = temperature_C ~ depth, data = NTL_LTER_subset)
##
## Residuals:
##     Min      1Q  Median      3Q     Max

## -0.8594989
```

8. Interpret your model results in words. Include how much of the variability in temperature is explained by changes in depth, the degrees of freedom on which this finding is based, and the statistical significance of the result. Also mention how much temperature is predicted to change for every 1m change in depth.

   Answer: There is a significant negative relationship between temperature and depth in July across all lakes. About 74% of the variability in temperature is explained by depth (F(1,9726)=2.75e+04, $p < .0001$). For every 1m increase in depth, temperture will decrease by about 1.95 degrees C.

Multiple regression

Let's tackle a similar question from a different approach. Here, we want to explore what might the best set of predictors for lake temperature in July across the monitoring period at the North Temperate Lakes LTER.

9. Run an AIC to determine what set of explanatory variables (year4, daynum, depth) is best suited to predict temperature.

10. Run a multiple regression on the recommended set of variables.

```
#9
NTL_LTER_AIC <- lm(temperature_C ~ year4 + daynum + depth, data=NTL_LTER_subset)
step(NTL_LTER_AIC)
```

```
## Start:  AIC=26065.53
## temperature_C ~ year4 + daynum + depth
##
##          Df Sum of Sq    RSS   AIC
## <none>                141687 26066
## - year4   1       101 141788 26070
## - daynum  1      1237 142924 26148
## - depth   1    404475 546161 39189
```

```
##
## Call:
## lm(formula = temperature_C ~ year4 + daynum + depth, data = NTL_LTER_subset)
##
## Coefficients:
## (Intercept)        year4       daynum        depth
##    -8.57556      0.01134      0.03978     -1.94644
```

```
#10
NTL_LTER_AIC_mod <- lm(temperature_C ~ year4 + daynum + depth, data=NTL_LTER_subset)
summary(NTL_LTER_AIC_mod)
```

```
##
## Call:
## lm(formula = temperature_C ~ year4 + daynum + depth, data = NTL_LTER_subset)
##
## Residuals:
##     Min      1Q  Median      3Q     Max
## -9.6536 -3.0000  0.0902  2.9658 13.6123
##
## Coefficients:
##              Estimate Std. Error  t value Pr(>|t|)
## (Intercept) -8.575564   8.630715   -0.994  0.32044
## year4        0.011345   0.004299    2.639  0.00833 **
## daynum       0.039780   0.004317    9.215  < 2e-16 ***
## depth       -1.946437   0.011683 -166.611  < 2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
```

```
##
## Residual standard error: 3.817 on 9724 degrees of freedom
## Multiple R-squared:  0.7412, Adjusted R-squared:  0.7411
## F-statistic:  9283 on 3 and 9724 DF,  p-value: < 2.2e-16
```

11. What is the final set of explanatory variables that the AIC method suggests we use to predict temperature in our multiple regression? How much of the observed variance does this model explain? Is this an improvement over the model using only depth as the explanatory variable?

    Answer: The final set of explanatory variabels that the AIC method suggested I use are year, daynum, and depth (all the same ones that were put in). This model explains about 74% of the observed variance in temperature. This is not an improvement over the model using depth as the only explanatory variable; the R-squareds are the same, yet the simple regression used less variables to achieve the same explanatory power, so the simple regression is more favorable.

Analysis of Variance

12. Now we want to see whether the different lakes have, on average, different temperatures in the month of July. Run an ANOVA test to complete this analysis. (No need to test assumptions of normality or similar variances.) Create two sets of models: one expressed as an ANOVA models and another expressed as a linear model (as done in our lessons).

```
#12
NTL_LTER_anova <- aov(temperature_C ~ lakename, data=NTL_LTER_subset)
summary(NTL_LTER_anova)
```

```
##               Df Sum Sq Mean Sq F value Pr(>F)
## lakename       8  21642  2705.2      50 <2e-16 ***
## Residuals   9719 525813    54.1
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
```

```

```

13. Is there a significant difference in mean temperature among the lakes? Report your findings.

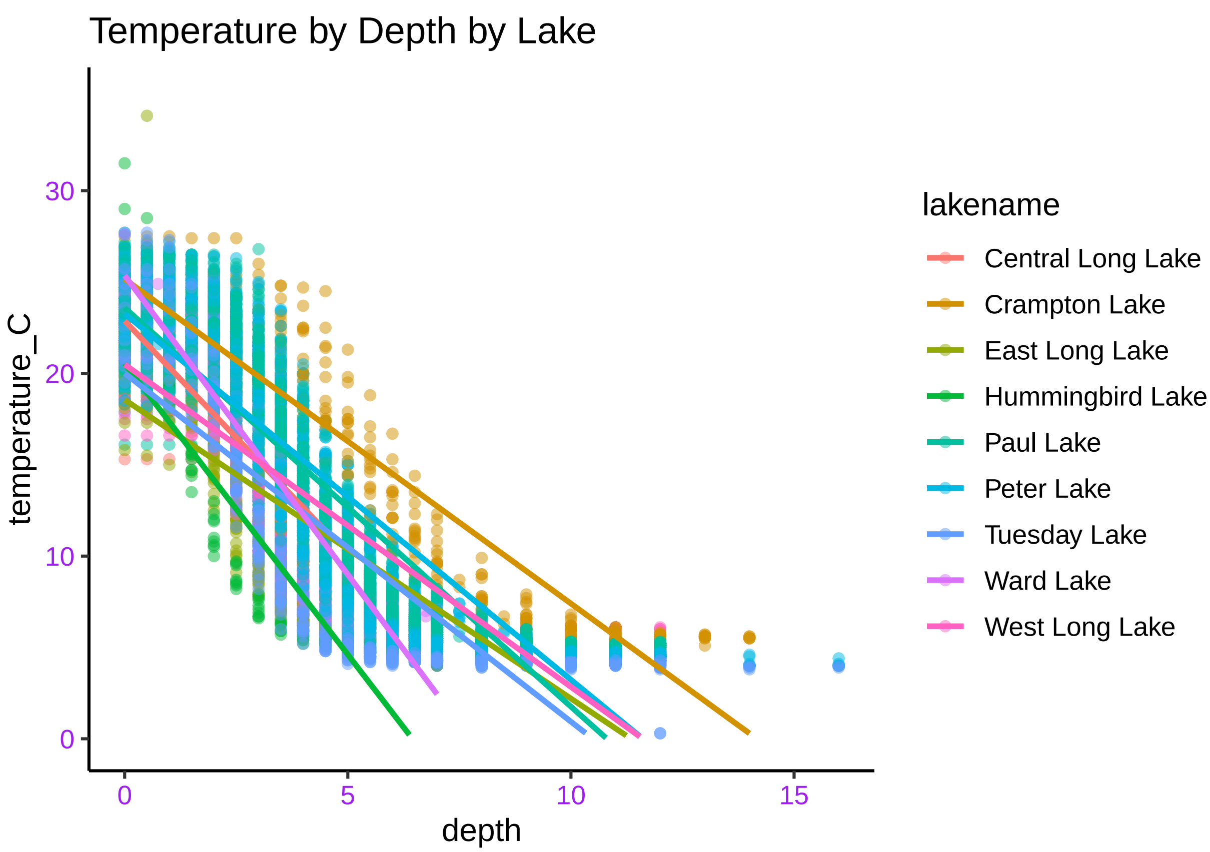
    Answer: There is a significant difference in mean temperature among the lakes ($F(8,9719)=50$, $p < .0001$).

14. Create a graph that depicts temperature by depth, with a separate color for each lake. Add a geom_smooth (method = "lm", se = FALSE) for each lake. Make your points 50 % transparent. Adjust your y axis limits to go from 0 to 35 degrees. Clean up your graph to make it pretty.

```r
#14.
ggplot(NTL_LTER_subset, aes(x=depth, y=temperature_C, col=lakename)) +
    geom_point(alpha=0.5) +
      geom_smooth(method="lm", se=F) +
        ylim(0,35) +
          ggtitle("Temperature by Depth by Lake")
```

```
## `geom_smooth()` using formula 'y ~ x'
```

```
## Warning: Removed 73 rows containing missing values (geom_smooth).
```



15. Use the Tukey's HSD test to determine which lakes have different means.

```
#15
TukeyHSD(NTL_LTER_anova)
```

```
##   Tukey multiple comparisons of means
##     95% family-wise confidence level
##
## Fit: aov(formula = temperature_C ~ lakename, data = NTL_LTER_subset)
##
## $lakename

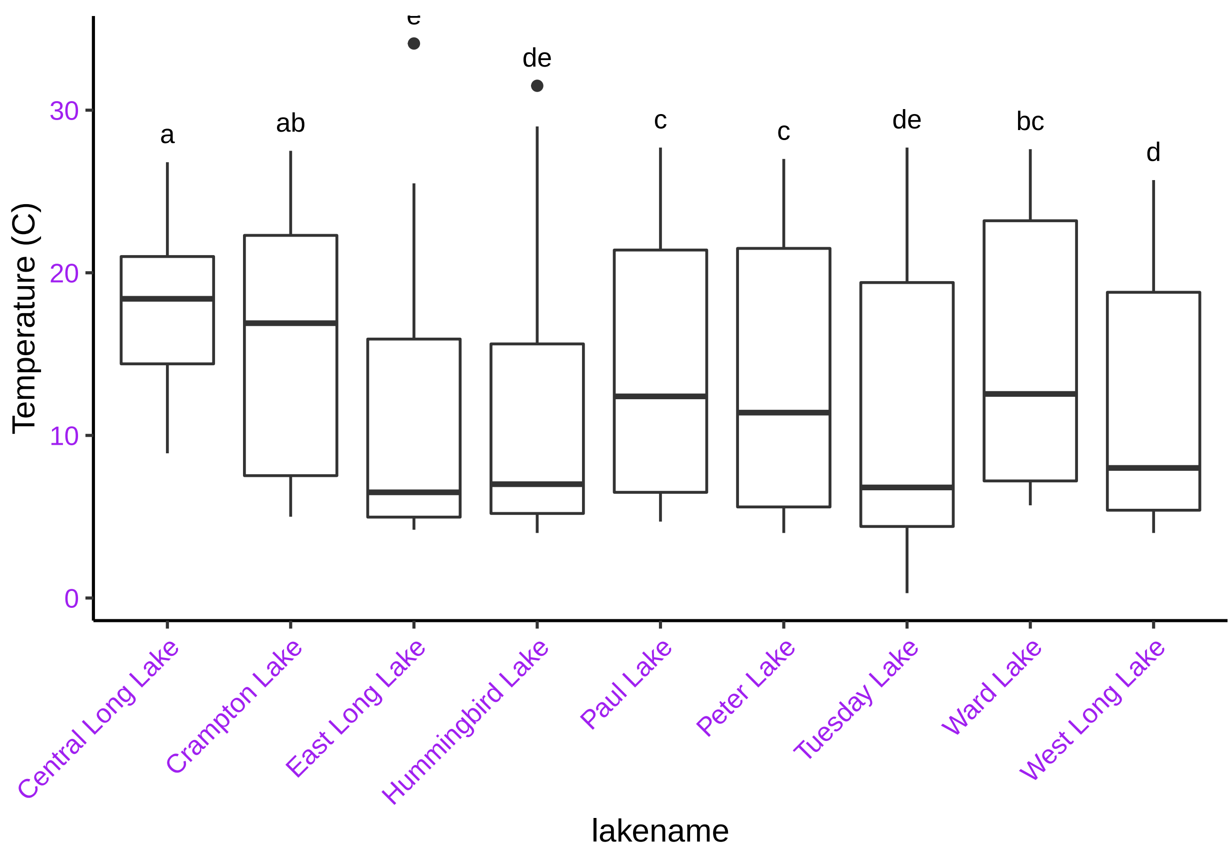
  labs(x = "lakename", y = "Temperature (C)")
print(NTL_LTERgroups_plot)
```



16.From the findings above, which lakes have the same mean temperature, statistically speaking, as Peter Lake? Does any lake have a mean temperature that is statistically distinct from all the other lakes?

> Answer: Paul Lake statistically has the same mean temperature as Peter Lake. Central Long Lake, Crampton Lake, Ward Lake, West Long Lake, and East Long Lake have mean temperatures that are statistically distinct from all other lakes.

17. If we were just looking at Peter Lake and Paul Lake. What's another test we might explore to see whether they have distinct mean temperatures?

    Answer: T-test
